

# Tutorial: Practical Use of SDR for Machine Learning in RF Environments

ACM-SE 2022

2022-04-18

12:30 – 15:30 (Central Time)

Neel Pandeya

National Instruments

Austin, Texas, USA

`neel.pandeya@ni.com`

`neel.pandeya@ettus.com`

# Agenda

- Introduction to SDR concepts, architecture, applications
- Overview of USRP B200, B210, B200mini
- Overview of SDR toolchains
- Overview of Radio Transport Protocols and Wireshark
- Overview of I/Q Data Rates and Sampling Rates
- Introduction to UHD
  - Building, installing, and configuring UHD on Linux
  - Various UHD Utility Programs
  - Using the UHD API from C++ and Python
  - Packet Flow Errors
- Introduction to GNU Radio
  - Building, installing, and configuring GNU Radio on Linux
  - Various GNU Radio Utility Programs
  - Using GRC, and creating and running flowgraphs
  - Examples with DTMF, filters, etc.
- Record & Playback of Signals
  - I/Q data formats, Digital RF, SigMF
- Introduction to GQRX
  - Building, installing, and configuring GQRX on Linux
  - Spectrum monitoring
  - Demo of gr-paint
- Implementing an FM receiver and transmitter in GNU Radio and gr-rds
- Technical Resources, Getting Help & Technical Support, Upcoming Events

# What is Software-Defined Radio (SDR)

- A radio in which some or all of the physical-layer functions are implemented in software running on a microprocessor (CPU) and/or on an FPGA
- Physical-layer algorithms from DSP and communications theory run as real-time software on a CPU and/or FPGA
- Software can run on an embedded DSP chip (e.g., Analog Devices TigerSHARC, Texas Instruments C6400) or a general-purpose CPU (e.g., Intel x86, ARM Cortex-M)
- Joe Mitola first coined the term “SDR” in an IEEE paper 1991

- Most radios use the classic superheterodyne receiver architecture
  - The RF signal from the antenna is mixed with a local oscillator to produce an intermediate frequency (IF) signal
  - The IF signal is a fixed lower-frequency signal, which is then filtered and further mixed (downconverted) to baseband

1. This block diagram shows a simplified superheterodyne receiver.

- Most SDR uses a direct-conversion receiver (DCR) architecture
  - Also called Zero-IF receiver, and homodyne receiver
  - Eliminates the intermediate frequency (IF) by translating the band of interest directly to baseband
  - The frequency of the LO is set to the same frequency as the transmitted/desired RF signal

2. This block diagram represents a simplified version of a direct-conversion receiver.

- Quadrature Sampling and I/Q Data
  - “I” is the in-phase (not shifted) data component
  - “Q” is the quadrature-phase (shifted by 90 degrees) data component
- Why do we use I/Q Data?
  - To fully determine the frequency and phase of a signal, and to be able to distinguish between positive and negative frequencies (needed for digitally processing the signal)
- Why 90 degrees?
  - So that the two components are orthogonal, meaning that their correlation is zero, further meaning that if the cosine signal is multiplied with the sine signal, and then the summation of the result is taken, this sum will be zero (the integral of the product of the sine and the cosine is zero).
  - A change in one component does not affect the other component

- Nyquist-Shannon Sampling Theorem

- $f_s > 2 * f_{max}$

- You must sample at least at twice the bandwidth of the signal, at least at twice the highest frequency component
  - If the sampling rate is lower than twice the bandwidth of the signal, then there will be *aliasing*, and information will be lost (the signal will likely be “*damaged*”)
  - Due to the quadrature sampling used in the USRP devices, the sampling rate can be equal to the signal bandwidth
  - Often, wireless standards will prescribe or require specific sampling rates, above the minimum sampling rate required

- Fast Fourier Transform (FFT)
  - An FFT is an algorithm that computes the Discrete Fourier Transform (DFT) of a signal, or its inverse (IDFT)
  - Fourier analysis converts a signal from the “time domain” to a representation in the frequency domain, and vice-versa
  - When we plot the FFT of a signal on a graph, it shows the spectrum of a signal, which is a plot of all the sine waves and cosine waves that constitute a signal, and this is called the spectrum of the signal
  - The sine waves and cosine waves are the fundamental building blocks of the signal (i.e., all signals can be constructed using sine waves and cosine waves), and the FFT plot is a visualization of those constituent and specific sine waves and cosine waves, at specific frequencies and at specific magnitudes

- Decibel (dB)
  - dB is a relative unit of measurement that expresses the ratio of two values *on a logarithmic scale*
  - dB is a *relative* value of power, not an *absolute* value of power, so it is dimensionless
  - $\text{Ratio}_{\text{dB}} = 10 * \log_{10}( P_{\text{measured}} / P_{\text{reference}} )$
  - When something doubles, it changes by +3 dB
  - When something halves, it changes by -3 dB
  - When something increases by a factor of ten, it changes by +10 dB
  - When something decreases by a factor of ten, it changes by -10 dB
  - When something increases by a factor of one hundred, it changes by +20 dB
  - 0 dB is equal to the reference value (i.e., 0 dBm is equal to one mW of power)
  - dBm is power with respect to 1 mW, so it is an *absolute* value of power, with units of mW
  - Why do we use dB?
    - Logarithmic scales are useful for measuring values that have a very large ranges of values
      - Used to measure sound level, earthquake intensity (Richter Scale), etc.

# USRP Architecture

Ettus

Research™

A National Instruments Company

# Why Use SDR?

- Traditional radios are hard-wired to specific frequency bands and communication protocols
  - Fixed-function, Black Box
  - Can't be easily modified, can't easily access internal values and states
- SDR provides:
  - Flexibility
  - Upgradability
  - Reconfigurability
  - Lower Cost

# Applications of SDR

- Voice-band Soft-modems / WinModems in 1990s and 2000s
- Cellular handsets (baseband processors such as Qualcomm Snapdragon, MediaTek, etc.)
- Cellular 4G/LTE and 5G/NR basestations (Eurecom OpenAirInterface (OAI), SRS srsRAN, Amarisoft)
- Cellular protocol stack emulation (2G/GSM, 3G/WCDMA, 4G/LTE, 5G/NR)
- GPS Receivers and Simulators
- Adaptive Radio and Cognitive Radio
- Satellite Communications (Ground Stations)
- Wireless Security Research
- Spectrum Monitoring
- Waveform Prototyping
- Wireless Systems Testing / Wireless Testbeds
- Radio Astronomy
- Drone Communications, Drone Detection, Drone Defense
- Direction Finding / Angle-of-Arrival
- Phased Arrays, Beam-forming and Beam-steering, MIMO Systems

*AI and ML have a role in all of these applications spaces!*

# Software Toolchains for SDR & USRP

- Processing can be either real-time or off-line / post-processing
- C++ and Python with the the USRP Hardware Driver (UHD) API (*open-source*)
- GNU Radio (Python, NumPy, SciPy, Matplotlib, etc.) (*open-source*)
- LabVIEW™ (National Instruments)
- MATLAB™ and Simulink™ (The MathWorks)
- Application-Specific:
  - Cellular: Eurecom OpenAirInterface (OAI), SRS srsRAN, Amarisoft
  - GPS: GNSS-SDR, GPS-SDR-Sim, Skydel Solutions SDX
  - Spectrum Monitoring: Fospor, SDR++, GQRX
  - Amateur Radio: HDSDR, SDR#, SDR-Console

# USRP Background

- About Ettus Research:
  - Founded in 2004 by Matt Ettus
  - Acquired by National Instruments in 2010
  - Offices in Santa Clara, California, USA; Austin, Texas, USA; Dresden, Germany
  - “USRP” is an acronym for *Universal Software Radio Peripheral*
- USRP Device Families:
  - B-series (B200, B210, B200mini): USB 3.0 host interface
  - N-series (N200, N210, N300/N310, N320/N321): 1 Gbps Ethernet host interface
  - X-series (X300, X310, X410): 1, 10, 100 Gbps Ethernet host interface
  - E-series (E310, E312, E313, E320): Embedded stand-alone SDR with ARM CPU

# USRP B200

- Xilinx Spartan 6 XC6SLX75 FPGA
- Analog Devices AD9364 RFIC direct-conversion transceiver
- Frequency range: 70 MHz to 6 GHz
- Up to 56 MHz of instantaneous bandwidth
- Maximum sampling rate of 61.44 Msps
- 1 Tx channel & 1 Rx channel
- USB 3.0 connectivity
- Optional GPSDO module

# USRP B210

Ettus

Research™

A National Instruments Company

- Xilinx Spartan 6 XC6SLX150 FPGA
- Analog Devices AD9361 RFIC direct-conversion transceiver
- Frequency range: 70 MHz to 6 GHz
- Up to 56 MHz of instantaneous bandwidth
- Maximum sampling rate of 61.44 Msps
- 2 Tx channels & 2 Rx channels
- USB 3.0 connectivity
- Optional GPSDO module

# USRP B200mini

- Xilinx Spartan-6 XC6SLX75 FPGA
- Analog Devices AD9364 RFIC direct-conversion transceiver
- Frequency range: 70 MHz to 6 GHz
- Up to 56 MHz of instantaneous bandwidth
- Maximum sampling rate of 61.44 Msps
- 1 Tx channel & 1 Rx channel
- USB 3.0 connectivity
- Powered from the USB 3.0 bus
- Size of a business card or credit card

# Sampling Rates

- Integer decimation of the Master Clock Rate (MCR)
  - Even decimation rate preferred
  - Odd decimation rate allowed but with warning of CIC filter roll-off attenuation
  - For B200, B210, B200mini:
    - All based on AD9361
    - MCR can be anything between 1 MHz and 61.44 MHz (30.76 MHz in 2x2)
    - Decimation rates between 1 and 1024

# I/Q Data Rates

- On the USRP B200, B210, B200mini, the I/Q data samples can be:
  - 16-bit I, 16-bit Q, for a total of 4 bytes per complex sample
  - 12-bit I, 12-bit Q, for a total of 3 bytes per complex sample
    - The ADC & DAC on the AD9361 are 12 bits anyway, so no loss of data or dynamic range
- USB 2.0 is 480 Mbits/s (60 MB/s) theoretical, so ~35 MB/s practical throughput, or ~8 Msps
- USB 3.0 is 5 Gbits/s (625 MB/s) theoretical, so ~350 MB/s practical throughput, or ~80 Msps
- 1 GbE is 1000 Mbits/sec (125 MB/sec) theoretical, so ~25 Msps, practical throughput
- 10 GbE is 10000 Mbits/sec (1250 MB/sec) theoretical, so ~250 Msps practical throughput
- Consider the load of the I/Q data rate on the transport, the CPU, and the disk
- Example: LTE signal, 20 MHz channel bandwidth
  - 30.72 Msps sampling rate, per 3GPP specifications
  - At 4 bytes per complex sample, the data rate is 122.88 Mbytes/s

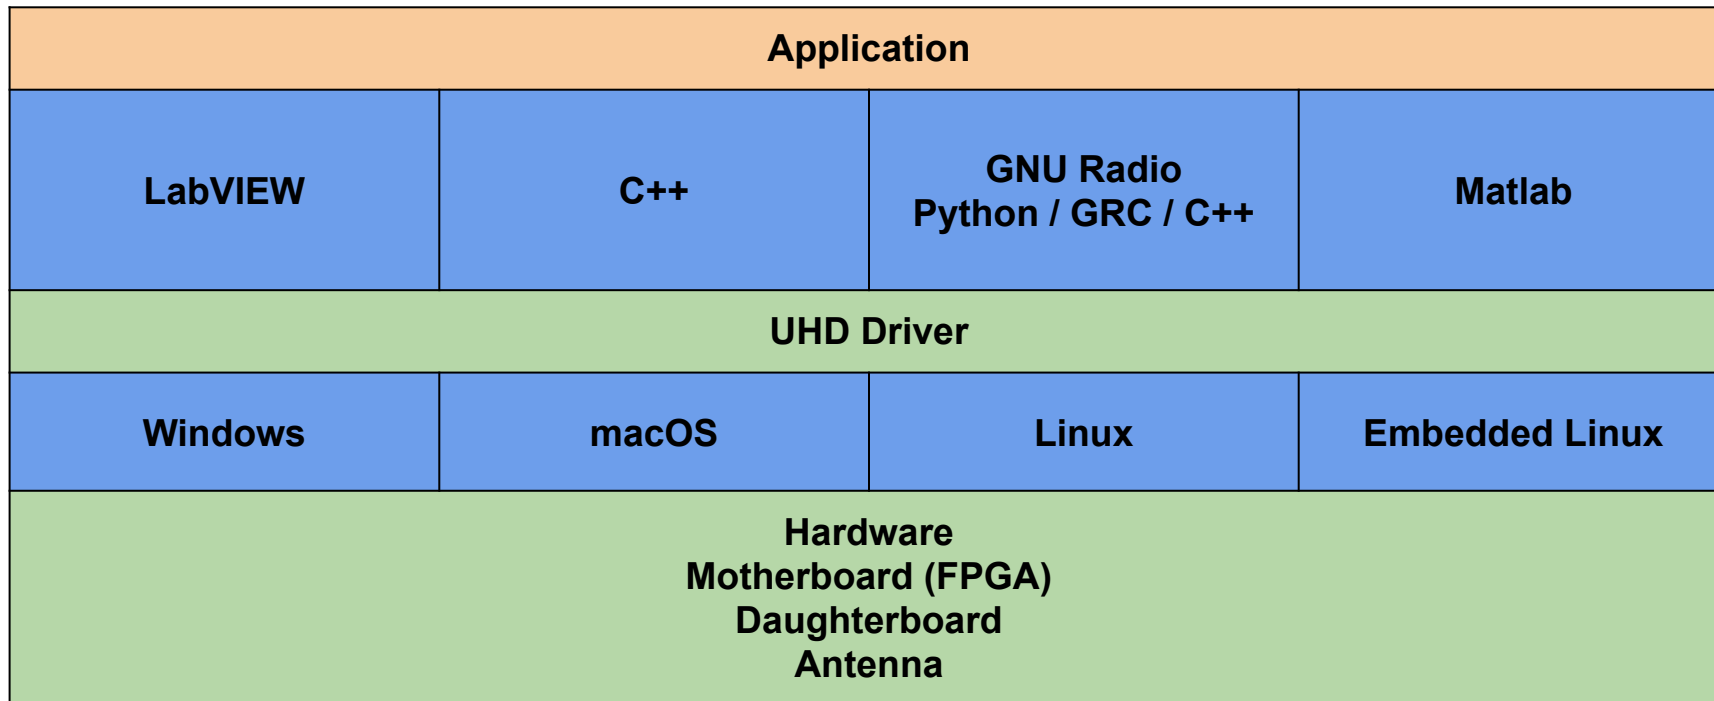

# USRP Hardware Driver (UHD)

- Provides a single, common interface (API) for all USRP devices
- Host-side software driver running in user-space
- Open-source and hosted on GitHub
- Cross-platform (Windows, macOS, Linux)
- Four components: host-side software; FPGA; MPM; firmware
- <https://github.com/EttusResearch>

# USRP Hardware Driver (UHD)

# UHD Version Numbering

- UHD and GNU Radio use a modified semantic version numbering (`major.API.ABI.patch`)
  - MAJOR version as necessitated by product generation & architecture
  - API version, incremented when incompatible API changes are made
  - ABI version, incremented when incompatible ABI changes are made
  - PATCH version, incremented when backwards-compatible bug fixes are made
- The API number changes whenever there is any change to the API
- The ABI pertains to how external applications communicate with (link to) the UHD library
- The patch number is incremented when patches are made, typically for bug fixes

# Radio Transport Protocols

Radio transport protocols are used to exchange I/Q samples (or other items) between host computer and USRP devices over Ethernet and USB

The USRP B200, B210, B200mini use the **CHDR** (compressed header) protocol, which is based on VITA-49.2

It is pronounced like the cheese "cheddar"

I/Q data traffic can be used in Wireshark, and there is a dissector for CHDR packets

# Radio Transport Protocols

The CHDR packet:

Address (Bytes)	Length (Bytes)	Payload
0	8	Compressed Header (CHDR)
8	8	Fractional Time (Optional!)
8/16	-	Data

# Radio Transport Protocols

The 64 bits in the compressed header have the following meaning:

Bits	Meaning
63:62	Packet Type
61	Has fractional time stamp (1: Yes)
60	End-of-burst or error flag
59:48	12-bit sequence number
47:32	Total packet length in Bytes
31:0	Stream ID (SID)

# Radio Transport Protocols

Ettus

Research™

A National Instruments Company

The packet type is determined mainly by the first two bits, although the EOB or error flag are also taken into consideration:

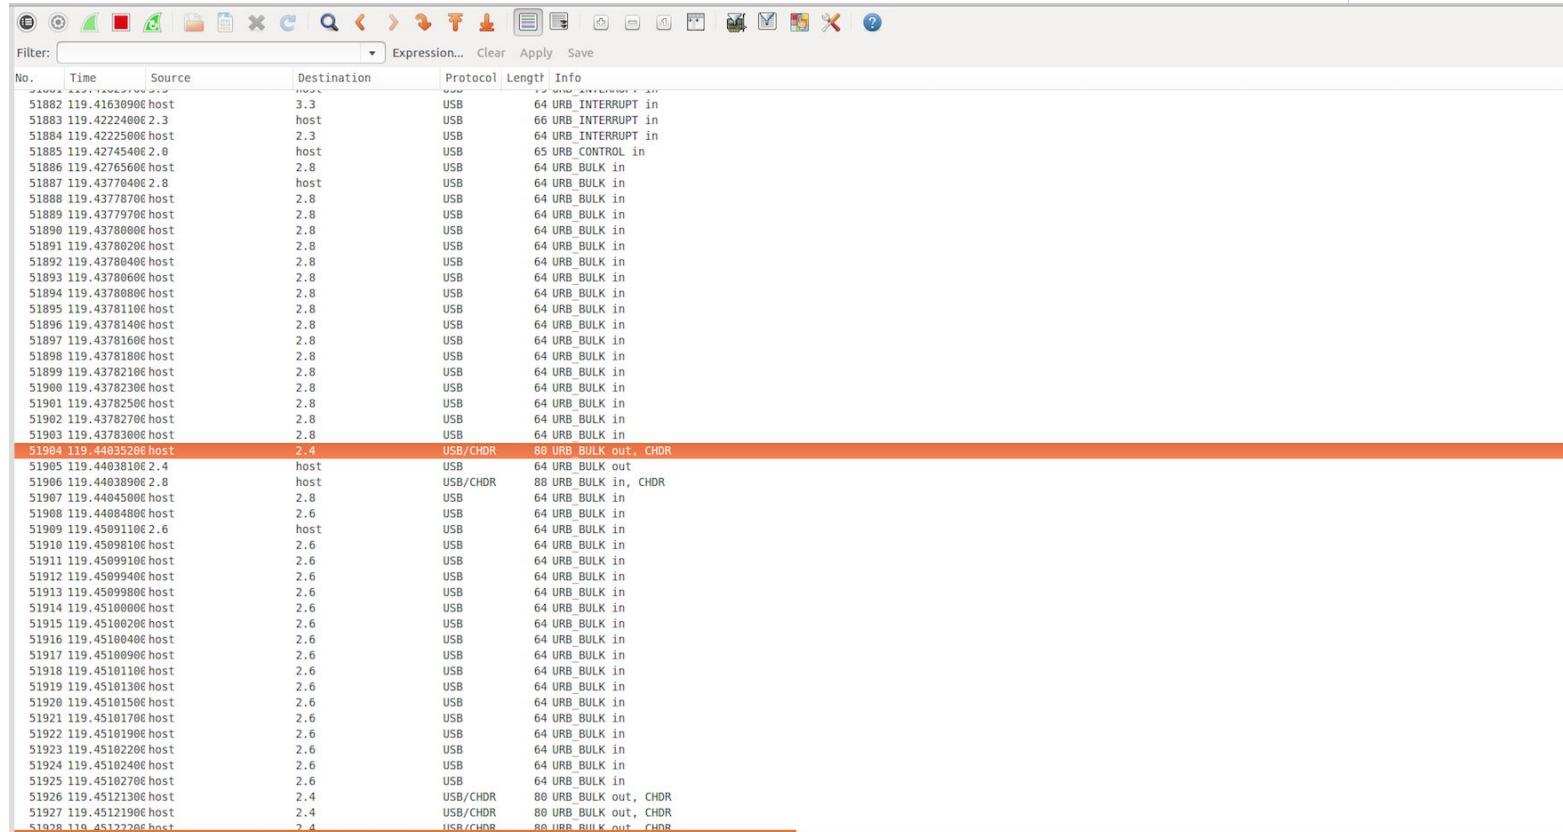

Bit 63	Bit 62	Bit 60	Packet Type
0	0	0	Data
0	0	1	Data (End-of-burst)
0	1	0	Flow Control
1	0	0	Command Packet
1	1	0	Command Response
1	1	1	Command Response (Error)

# The UHD Repository on GitHub

## **host/**

This folder contains the source code for the host-side driver

## **firmware/**

This folder contains the source code for all microcontrollers in USRP hardware

## **fpga/**

This folder contains the source code and build scripts for the USRP FPGAs

## **mpm/**

This folder contains the source code for the Module Peripheral Manager (MPM) for embedded USRP devices

## **images/**

This folder contains tools for downloading the USRP FPGA images, which are located in the `/usr/local/share/uhd/images` folder by default

## **tools/**

This folder contains additional tools and utility programs

# Installing UHD from Source Code

Ettus

Research™

A National Instruments Company

1. `sudo apt-get install libboost-all-dev libusb-1.0-0-dev python-mako doxygen  
python-docutils cmake build-essential libncurses5 libncurses5-dev`
2. `mkdir ~/workarea; cd ~/workarea`
3. `git clone git://github.com/EttusResearch/uhd.git`
4. `cd uhd/`
5. `git checkout v4.1.0.5`
6. `cd host/`
7. `mkdir build && cd build`
8. `cmake ../`
9. `make -j4`
10. `make test`
11. `sudo make install`
12. `sudo ldconfig`

# Installing UHD from Binary Package

- Binary packages available on Ubuntu Launchpad PPA
- Recommend building from source code
  - Much more flexible when doing development
- The binary packages are less flexible and are often older or out-of-date
  - Use when doing deployment

# Post-Installation Steps

- Add this line to your `$HOME/.bashrc` file, and *source* it, or logout and log back in:

```
export LD_LIBRARY_PATH=/usr/local/lib
```

```
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/usr/local/lib
```

- On Linux, `udev` handles USB plug and unplug events. The following commands install a `udev` rule so that non-root users may access the device. Without this, you will not see the radio as a normal user. This step is only necessary for devices that use USB to connect to the host computer, such as the B200, B210, and B200mini.

```
cd <path-to-uhd-repository>/uhd/host/utils
```

```
sudo cp uhd-usrp.rules /etc/udev/rules.d/
```

```
sudo udevadm control --reload-rules
```

```
sudo udevadm trigger
```

- For USRP devices that use Ethernet to connect to the host computer, such as the N200, N210, X300, X310, set the IP address of your system to 192.168.10.1, with a netmask of 255.255.255.0. The default IP address of the USRP is 192.168.10.2 (for 1 GbE), and 192.168.40.2 (for 10 GbE), with a netmask of 255.255.255.0.
- Use Network Manager GUI (in Unity, KDE, GNOME, Xfce, etc.) to set the IP address. If you set the IP address from the command line with `ifconfig`, then Network Manager may probably overwrite this.

# UHD Utility - uhd\_images\_downloader

```
sudo /usr/local/lib/uhd/utils/uhd_images_downloader.py
```

```
user@host:~$ sudo /usr/local/lib/uhd/utils/uhd_images_downloader.py
Images destination:      /usr/local/share/uhd/images
Downloading images from: http://files.ettus.com/binaries/images/uhd-images_003.009.002-release.zip
Downloading images to:   /tmp/tmpGYYPwE/uhd-images_003.009.002-release.zip
26296 kB / 26296 kB (100%)

Images successfully installed to: /usr/local/share/uhd/images
user@host:~$

Gain Elements: None

# UHD Arguments

Ettus

Research™

A National Instruments Company

Most UHD applications and examples make use of the `--args` parameter to select specific devices

Common argument keys: `serial`, `addr`, `resource`, `name`, `type`, `vid/pid`.

```
$ uhd_find_devices --args "addr=192.168.10.2" (for USRP N2xx / X3xx)
```

```
$ uhd_find_devices --args "type=b200,serial=xxxxxxx" (for B2xx)
```

Note that multiple arguments are comma-delimited

This will return the devices at the specific IP address, and can be used to overcome previously mentioned network obstacles.

```
x - thilina@thilina-ubuntu: ~
thilina@thilina-ubuntu:~$ uhd_find_devices --args "addr0=192.168.10.2, addr1=192.168.20.2"

# UHD Utility Programs

- Default installation location is `/usr/local/lib/uhd/utils`
- `uhd_config_info`
  - Prints detailed UHD configuration information
- `uhd_images_downloader`
  - Downloads FPGA images for the current UHD version
- `uhd_image_loader`
  - Writes an FPGA image into the flash memory for the X300/X310 FPGA
- `usrp_burn_mb_eeprom`
  - Reading and writing motherboard EEPROM
- `usrp_burn_db_eeprom`
  - Reading and writing daughterboard EEPROM

# UHD Example Programs

- Default installation location is `/usr/local/lib/uhd/examples`
- `rx_ascii_art_dft`
  - Creates ASCII/Ncurses FFT
  - `./rx_ascii_art_dft --freq 98e6 --rate 5e6 --gain 20 --bw 5e6 --ref-lvl -50`
- `rx_samples_to_file`
  - Saves samples to file
  - `./rx_samples_to_file --freq 98e6 --rate 5e6 --gain 20 usrp_samples.dat`
- `tx_samples_from_file`
  - Transmits samples from file
  - `./tx_samples_from_file --freq 915e6 --rate 5e6 --gain 10 usrp_samples.dat`
- `benchmark_rate`
  - Benchmarks interface with device
  - `./benchmark_rate --rx_rate 10e6 --tx_rate 10e6`
- `tx_waveforms`
  - Transmits specific waveform
  - `./tx_waveforms --freq 915e6 --rate 5e6 --gain 0`

# Packet Flow Errors

- Packet flow errors printed in console/terminal as upper-case letters:
- Underrun on Tx ("U"):
  - Samples not being produced by the host application fast enough. CPU governor or other power management not configured correctly.
- Overrun on Rx ("O"):
  - Samples not being consumed by the host application fast enough. CPU governor or other power management not configured correctly.
- Sequence Error on Tx ("S"):
  - Network hardware failure. Check host NIC, cable, switch, etc. Frame size might not work with the current NIC's MTU.
- Dropped Packet on Rx ("D"):
  - Network hardware failure. Check host NIC, cable, switch, etc. PCIe bus on host cannot sustain throughput. CPU governor or other power management not configured correctly. Frame size might not work with the current NIC's MTU. Check "`ethtool -s <interface>`".
- Late Packet on Tx ("L"):
  - Samples are not being produced by user's application fast enough. CPU governor or other power management not configured correctly. Incorrect/invalid `time_spec` provided. Usually on MIMO.

# Using UHD API

- The UHD API can be used from:
  - C++ (native)
  - Python 3
- For C++, can compile with:
  - GCC
  - LLVM/Clang
  - Microsoft Visual Studio
  - macOS Xcode
- Uses the CMake build system
  - An example `CMakeLists.txt` file provided for getting started with building custom stand-alone applications

# Using UHD API from C++

```

std::cout << boost::format("Setting RX Freq: %f MHz...") % (freq / 1e6) << std::endl;
uhd::tune_request_t tune_request(freq);
usrp->set_rx_freq(tune_request);
std::cout << boost::format("Actual RX Freq: %f MHz...") % (usrp->get_rx_freq() / 1e6) << std::endl << std::endl;
```

# Using UHD API from C++

```
// set the rf gain
std::cout << boost::format("Setting RX Gain: %f dB...") % gain << std::endl;
usrp->set_rx_gain(gain);
std::cout << boost::format("Actual RX Gain: %f dB...") % usrp->get_rx_gain() << std::endl << std::endl;

// set the antenna
std::cout << boost::format("Setting RX Antenna: %s") % ant << std::endl;
usrp->set_rx_antenna(ant);
std::cout << boost::format("Actual RX Antenna: %s") % usrp->get_rx_antenna() << std::endl << std::endl;

return EXIT_SUCCESS;
}
```

# Building UHD C++ Program

- Use the `uhd/host/examples/init_usrp/CMakeLists.txt` file as template
- Add the names of your C++ source files to the `add_executable(...)` section
- Put both modified `CMakeLists.txt` file and C++ file into an empty folder
- Create a “build” folder and invoke CMake the usual way:

```
mkdir build
```

```
cd build
```

```
cmake ../
```

```
make -j4
```

# Building UHD C++ Program

- `init_usrp` example included as `~/ettus_workshop/examples/usrp_basic`

```
$ cd ~/ettus_workshop/examples/usrp_basic
```

```
$ mkdir build
```

```
$ cd build
```

```
$ cmake ..
```

```
$ make
```

```
$ ./usrp_basic
```

```
$ ldd ./usrp_basic
```

# Building UHD C++ Program

```

# GNU Radio

- Open-source framework for SDR and signal processing
- Block-based dataflow architecture
- Each block runs in its own thread
- Data flows through a graph called a Flowgraph
- Blocks are nodes in a Flowgraph, and perform operations and signal processing
- Signals normalized between -1.0 and +1.0
- Similar in concept to LabVIEW™ and Simulink™
- Running C++ and Python under-the-hood
- Can write code directly, or use the GNU Radio Companion (GRC) graphical tool
- Hosted on GitHub at <https://github.com/gnuradio/gnuradio>
- Homepage is <http://gnuradio.org/>

# Installing GNU Radio from Source Code

Ettus

# Installing GNU Radio from Source Code

1. `cd ~/workarea`
2. `git clone --recursive https://github.com/gnuradio/gnuradio.git`
3. `cd gnuradio/`
4. `git checkout v3.8.5.0`
5. `mkdir build && cd build`
6. `cmake ../`
7. `make -j4`
8. `sudo make install`
9. `sudo ldconfig`

# Installing GNU Radio from Binary Package

- Binary packages available on Ubuntu Launchpad PPA
  - Recommend building from source code
    - Much more flexible when doing development
  - The binary packages are less flexible and are often older or out-of-date
    - Use when doing deployment

- Utility program to print detailed GNU Radio configuration information
  - `gnuradio-config-info --version` (or `-v`)
  - `gnuradio-config-info --prefix`
  - `gnuradio-config-info --enabled-components`
  - `gnuradio-config-info --print-all`

# GNU Radio Examples

- Many examples included with GNU Radio installation
- Located at:

```
<install_path>/share/gnuradio/examples/  
  
/usr/local/share/gnuradio/examples/
```

# Dual-tone multi-frequency signaling (DTMF)

In-band telecommunication signaling system using the voice-frequency band over telephone lines between telephone equipment and other communications devices

The DTMF telephone keypad is laid out in a 4×4 matrix of push buttons in which each row represents the low frequency component and each column represents the high frequency component of the DTMF signal.

**DTMF keypad frequencies**

	1209 Hz	1336 Hz	1477 Hz	1633 Hz
697 Hz	1	2	3	A
770 Hz	4	5	6	B
852 Hz	7	8	9	C
941 Hz	*	0	#	D

# GNU Radio Dial Tone Example

- Dial Tone Example

- Generates a PSTN dial tone
- Does not use any hardware
- Verifies that all libraries can be found, and the GR run-time is working
- Run the following example:

```
$ python ~/ettus_workshop/flowgraphs/dial_tone_basic.py
```

- Flowgraph located at:

```
~/ettus_workshop/flowgraphs/dial_tone_basic.grc
```

# Throttle Block

- Distinct from a mathematical (DSP) calculation context, sample rate also refers to the rate at which samples pass through the flowgraph
- If there is no rate control, hardware clock, or throttling mechanism, then the samples will be generated, pass through the flowgraph, and be consumed as fast as possible (i.e., the flowgraph will be only CPU-bound)
- This is desirable if you want to perform some specific DSP on data as quickly as possible (e.g., read from a file, re-sample, and write it back to disk)
- Only a block that represents some underlying hardware with its own clock (e.g. USRP, sound card), or the Throttle Block itself, will use 'Sample Rate' to set that hardware clock, and therefore have the effect of applying rate control to the samples in the flowgraph
- Not having a Throttle Block in a flowgraph where it's needed may result in the flowgraph consuming 100% of your CPU, and your system becoming unresponsive

# Throttle Block (cont'd)

- A Throttle Block will simply apply host-based timing (against the 'wall clock') to control the rate of the samples it produces (i.e. samples that it makes available on its outputs to downstream blocks)
- A hardware Sink block will consume samples at a fixed rate (relative to the wall clock)
- The Throttle Block, or a hardware Sink block, will apply 'back pressure' to the upstream blocks (the rate of work of the upstream blocks will be limited by the throttling effect of this rate-controlling block)
- A hardware Source block will produce samples at a fixed rate (relative to the wall clock)
- In general, there should only ever be one block in a flowgraph that has the ability to throttle sample flow

# Components of GNU Radio

- GNU Radio is comprised of components
- Components consist of blocks as well as other functionality
- The top-level components included in the GNU Radio distribution are:

## Fundamentals

- **gr-analog**
  - Blocks for analog communications
- **gr-block**
  - Basic block library
- **gr-digital**
  - Blocks for digital communications
- **gr-fec**
  - Forward Error Correction signal processing blocks

# Components of GNU Radio

- **gr-fft**
  - FFT signal processing blocks
- **gr-filter**
  - Filter signal processing blocks
- **gr-runtime**
  - GNU Radio core runtime infrastructure
- **gr-trellis**
  - Trellis-based algorithms for GNU Radio
- **gr-vocoder**
  - Blocks implementing voice codecs
- **gr-wavelet**
  - Wavelet signal processing blocks for GNU Radio

# Components of GNU Radio

## Graphical Interfaces

- `gr-gtgui`
  - QT 5 GUI Interface
  - QT is the default/primary GUI toolkit
  - wxWidgets fully deprecated and no longer supported

# Components of GNU Radio

## Hardware Interfaces

- **gr-audio**
  - Block for all supported audio sound systems
- **gr-comedi**
  - Blocks for the comedi library
- **gr-fcd**
  - Funcube Dongle source block for GNU Radio
- **gr-shd**
  - Blocks for the Simplex Hardware Driver (SHD)
- **gr-uhd**
  - Blocks to interface with USRP / UHD
- **gr-osmocom**
  - Universal Block to interface with various SDR Hardware

# Out-of-Tree (OOT) Modules

- An OOT module is a GNU Radio component that does not live within the GNU Radio source tree, and is not included with the GNU Radio distribution
- OOT modules allow third-parties to extend GNU Radio with their functions and blocks
- Comprehensive GNU Radio Archive Network (CGRAN)
  - Directory of open-source OOT modules
  - Not a hosting site
  - Most OOT modules are hosted on GitHub
  - <http://www.cgran.org/>
- **gr\_modtool**
  - The swiss army knife of module editing / creating
  - <https://gnuradio.org/redmine/projects/gnuradio/wiki/OutOfTreeModules>

## The Comprehensive GNU Radio Archive Network

The Comprehensive GNU Radio Archive Network (CGRAN) is a free open source repository for 3rd party GNU Radio applications a.k.a Out Of Tree Modules that are not officially supported by the GNU Radio project.

# Out-of-Tree Module Installation

1. `git clone <repository>`
2. `cd <repository-path>`
3. `mkdir build && cd build`
4. `cmake ../`
5. `make -j4`
6. `sudo make install`
7. `sudo ldconfig`

# Record & Playback of Signals

- There are many ways to record files and playback files, and this can be highly customized
- Use UHD utility programs
  - Use existing utility programs in GitHub
    - <https://github.com/EttusResearch/uhd/tree/master/host/examples>
  - Customize them to modify and add functionality
  - Either in C++ or in Python
    - [https://github.com/EttusResearch/uhd/blob/master/host/examples/rx\\_samples\\_to\\_file.cpp](https://github.com/EttusResearch/uhd/blob/master/host/examples/rx_samples_to_file.cpp)
    - [https://github.com/EttusResearch/uhd/blob/master/host/examples/python/rx\\_to\\_file.py](https://github.com/EttusResearch/uhd/blob/master/host/examples/python/rx_to_file.py)
- Use GNU Radio
  - Easy to do with a flowgraph
  - Can easily add in-line, real-time signal processing
- Various data types supported: Complex, Int, Short, Float, Double, etc.
- The higher the sampling rate:
  - The higher the disk usage
  - The higher the disk IO
    - Use NVMe disks, not SATA disks, not external USB flash disks

# Record & Playback of Signals

- Record Signal using UHD utility program:

```
$ /usr/local/lib/uhd/examples/rx_samples_to_file \  
  --args "type=b200" \  
  --type float \  
  --freq 433.72e6 \  
  --rate 1e6 \  
  --gain 10 \  
  --ant TX/RX \  
  --bw 1e6 \  
  --file my_iq_datafile.f32
```

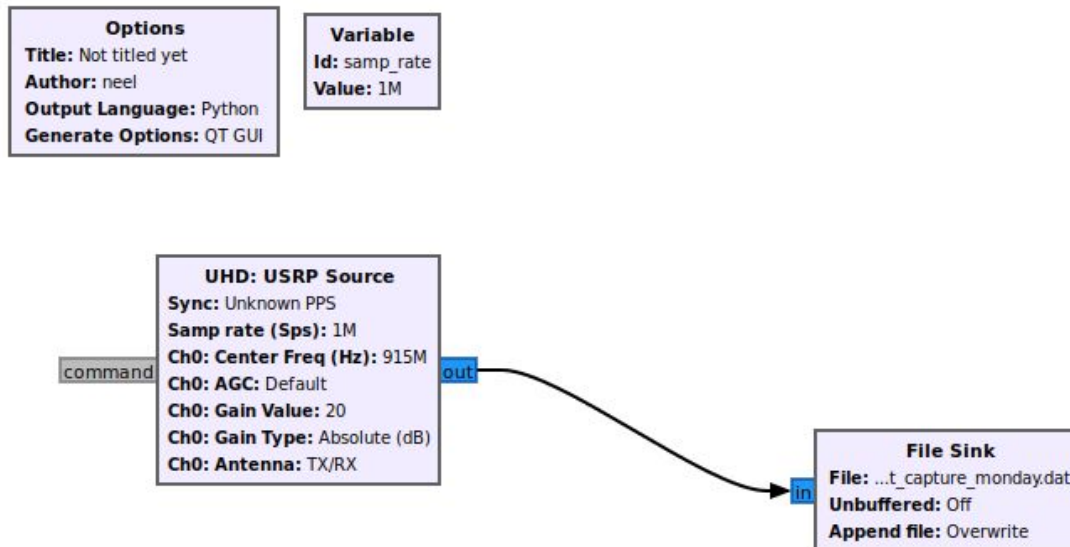

# Record & Playback of Signals

- Playback Signal using UHD utility program:

```
$ /usr/local/lib/uhd/examples/tx_samples_from_file \  
  --args "type=b200" \  
  --type float \  
  --freq 433.72e6 \  
  --rate 1e6 \  
  --gain 50 \  
  --ant TX/RX \  
  --bw 1e6 \  
  --file my_iq_datafile.f32
```

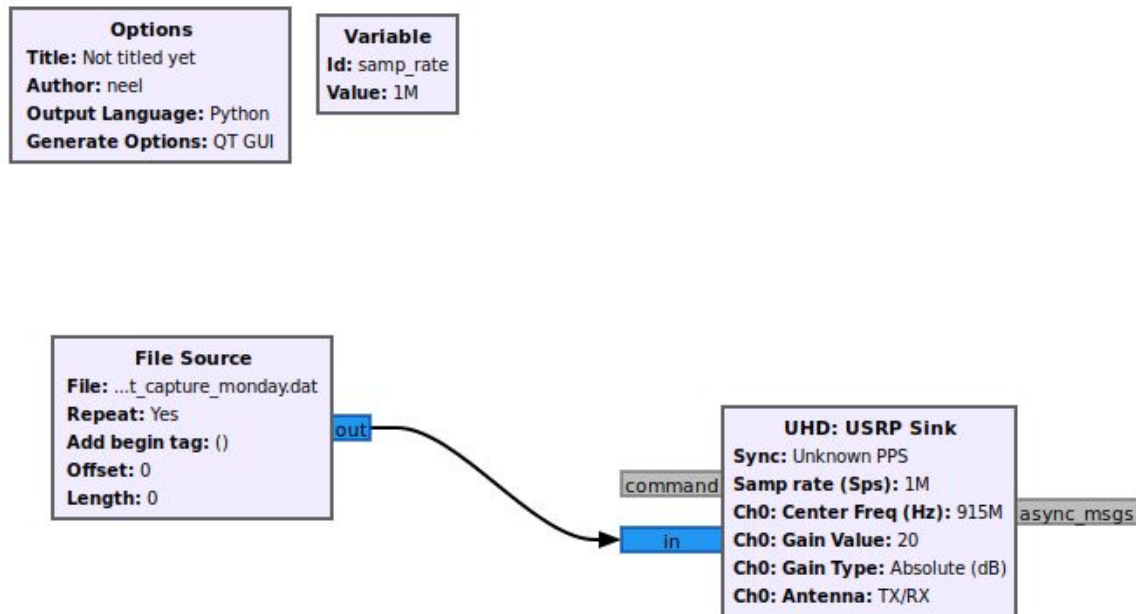

# Record & Playback of Signals

- Record Signal using GNU Radio flowgraph:

# Record & Playback of Signals

- Playback Signal using GNU Radio flowgraph:

# Signal Data Formats

- The previous examples read and write raw I/Q data files
  - Fast to read, write, and process, but there is no header and no metadata
- Often, over time, it becomes difficult to manage large sets of raw signal capture files
  - You cannot remember, and/or did not document, the system configuration used for the capture
  - Trying to track this in the filename is tedious, error-prone, and does not scale
    - Cannot easily annotate captures
  - Difficult to archive, organize, and then later re-use captures
  - Difficult to share captures with other colleagues for collaboration
  - Difficult to create, organize, and publish data sets consisting of multiple captures
  - Inhibits the ability to reproduce research results
  - Basically, highly susceptible to “*bit rot*”

- The Signal Metadata Format (SigMF) specifies a way to describe sets of recorded digital signal samples with metadata written in JSON. SigMF can be used to describe general information about a collection of samples, the characteristics of the system that generated the samples, and features of the signal itself.
- Designed to enable easy sharing, archiving, and publishing of datasets
- Open specification and open-source implementation on GitHub
- Can be used from C++, Python, GNU Radio (*not specific to GNU Radio*)
- Metadata is written with JSON
- <https://github.com/gnuradio/SigMF>
- <https://pypi.org/project/SigMF/>
- A SigMF recording is one flat data file and one flat metadata file
  - The data file is just raw samples
  - The metadata file is a JSON file with several sections
- Recordings can be stored and distributed in an archive format
- Archives have a defined directory structure for including multiple recordings

- The JSON file contains several sections:
  - Global section: The General information about the file. The minimal information needed to parse the dataset file. Example fields:
    - Datatype: How are the samples stored?
    - Sample Rate: What is the sample rate at which this data was recorded?
    - Author: Who created these files?
    - Version: Which version of the SigMF specification was used to create this capture?
    - License: What is the license of this data?
    - Hash: A hash of the data to provide proof of integrity.
    - Description: A top-level description of the capture dataset.

- The JSON file contains several sections:
  - Captures section: An array of segments that describe the parameters of the capture, starting at a certain sample index. Example fields:
    - Center Frequency: At what frequency was the radio tuned to during the capture?
    - Timestamp: What is the timestamp of a particular sample index?
  - Annotations section: An array of segments that describe features or provides comments about the signal data. Specified by sample number. Can be *"code comments"* like "detected interference here", "classified modulation as QAM64", "cat jumped on antenna", etc.

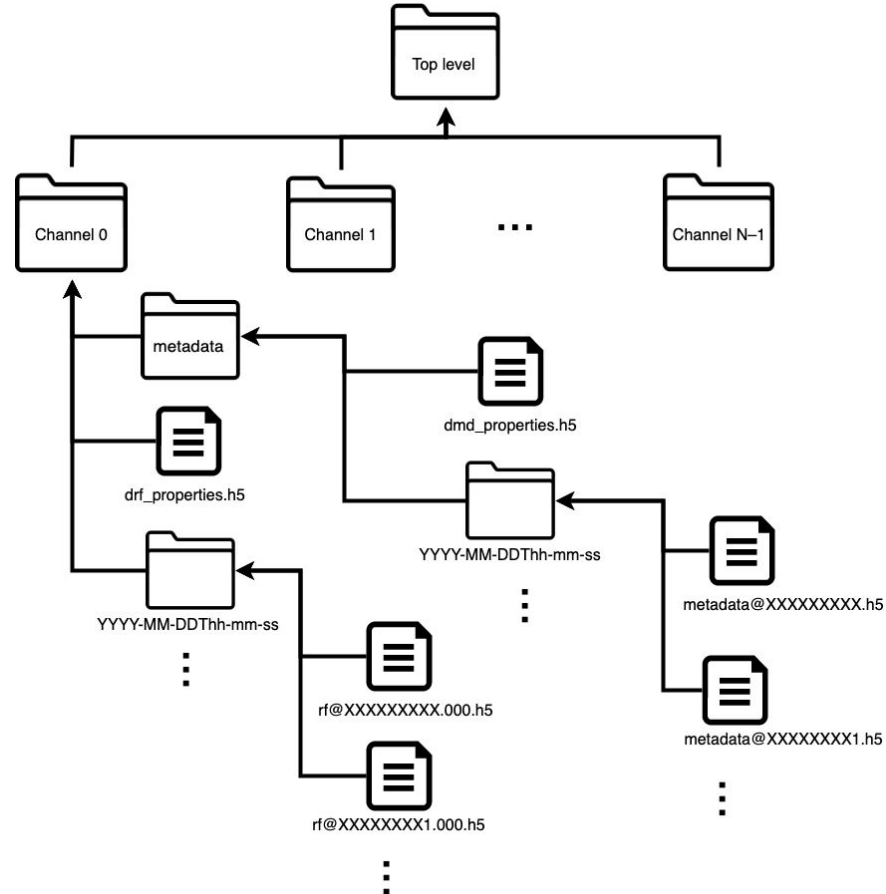

- How to handle continuously-varying fields/metadata?
  - Dealing with fields that are continuously changing can be a significant challenge for metadata
  - Examples:
    - If your receiver is in a vehicle, how do you record the changing geolocation in a useful way?
    - If your antenna is a spinning dish, how do you record the changing azimuth of your aperture?
  - These continuously-varying fields/metadata are just another SigMF recording
- Several open-source tools now have SigMF integration:
  - Inspectrum
  - Universal Radio Hacker (URH)
  - GNU Radio (dedicated blocks)

```

32    },
33  ],
34 }
```

# Digital RF

- Driven by MIT Haystack Observatory
- Based on the more-generalized Hierarchical Data Format (HDF), version 5
- Specifically designed to store and organize large amounts of data
- HDF5 used by NASA, NOAA, and many other government agencies and scientific research organizations
- HDF5 has a hierarchical structure, and is more complicated than SigMF, which is flat and easy-to-parse
- [https://github.com/MITHaystack/digital\\_rf](https://github.com/MITHaystack/digital_rf)
- [https://en.wikipedia.org/wiki/Hierarchical\\_Data\\_Format](https://en.wikipedia.org/wiki/Hierarchical_Data_Format)
- The Digital RF software suite includes:
  - Libraries for reading and writing data in C, Python, GNU Radio (dedicated blocks), and Matlab
  - The `thor.py` UHD radio recorder script
  - Python tools for managing and processing Digital RF data
  - Example scripts that demonstrate basic usage
  - Example applications that encompass a complete data recording and processing chain

# Open Datasets in SigMF and Digital RF

- Many open datasets are now being published using SigMF and Digital RF formats
- Some example public datasets:
  - “An IEEE 802.11 a/g (WiFi) massive-scale and labeled datasets for Radio Fingerprinting” from Northeastern University (NEU) in Boston
    - [https://www.northeastern.edu/wiot/wp-content/uploads/2020/07/dataset\\_release.pdf](https://www.northeastern.edu/wiot/wp-content/uploads/2020/07/dataset_release.pdf)
  - “RF Datasets For Machine Learning” from DeepSig
    - <https://www.deepsig.ai/datasets>
  - “Comprehensive LoRa RF Datasets for Device Fingerprinting Using Deep Learning” from Oregon State University
    - [http://research.engr.oregonstate.edu/hamdaoui/sites/research.engr.oregonstate.edu.hamdaoui/files/release\\_note\\_2021.pdf](http://research.engr.oregonstate.edu/hamdaoui/sites/research.engr.oregonstate.edu.hamdaoui/files/release_note_2021.pdf)
  - Data from the NASA Voyager 1 space probe from Daniel Estévez
    - <https://destevez.net/2021/09/decoding-voyager-1/>

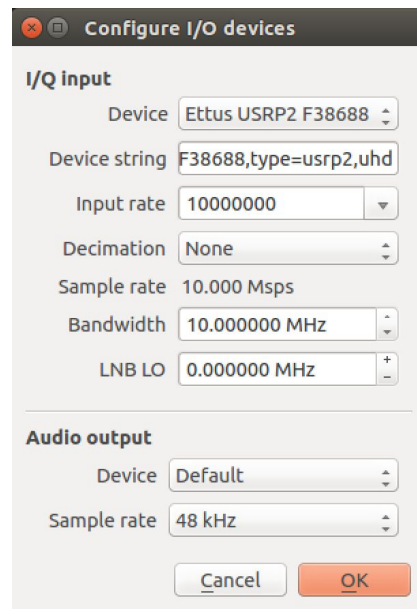

- Generic SDR hardware interface for GNU Radio
- Uses UHD under-the-hood
- Needed for GQRX
- <https://github.com/osmocom/gr-osmosdr>

1. `git clone git://git.osmocom.org/gr-osmosdr`
2. `cd gr-osmosdr/`
3. `mkdir build && cd build`
4. `cmake ../`
5. `make -j4`
6. `sudo make install`
7. `sudo ldconfig`

- A free open-source SDR receiver built on GNU Radio and QT
- Features:
  - Real-time FFT plot and waterfall
  - Demodulators for AM, SSB, NBFM (mono), WBFM (stereo)
  - Record and playback to/from IQ file
  - Basic remote control through TCP socket connection
- Created by Alexandru Csete in Denmark
- <http://gqrx.dk/>
- <https://github.com/csete/gqrx>

# Installing GQRX

1. `sudo apt-get install qt5-default qttools5-dev-tools libqt5svg5 libqt5svg5-dev`
  2. `git clone https://github.com/csete/gqr.x.git`
  3. `cd gqr.x`
  4. `mkdir build && cd build`
  5. `cmake ../`
  6. `make -j4`
  7. `sudo make install`
  8. `sudo ldconfig`
- To start, run at command prompt: `gqr.x`
  - Select Device, Set Input Rate, Decimation and Bandwidth

# GQRX Screenshot

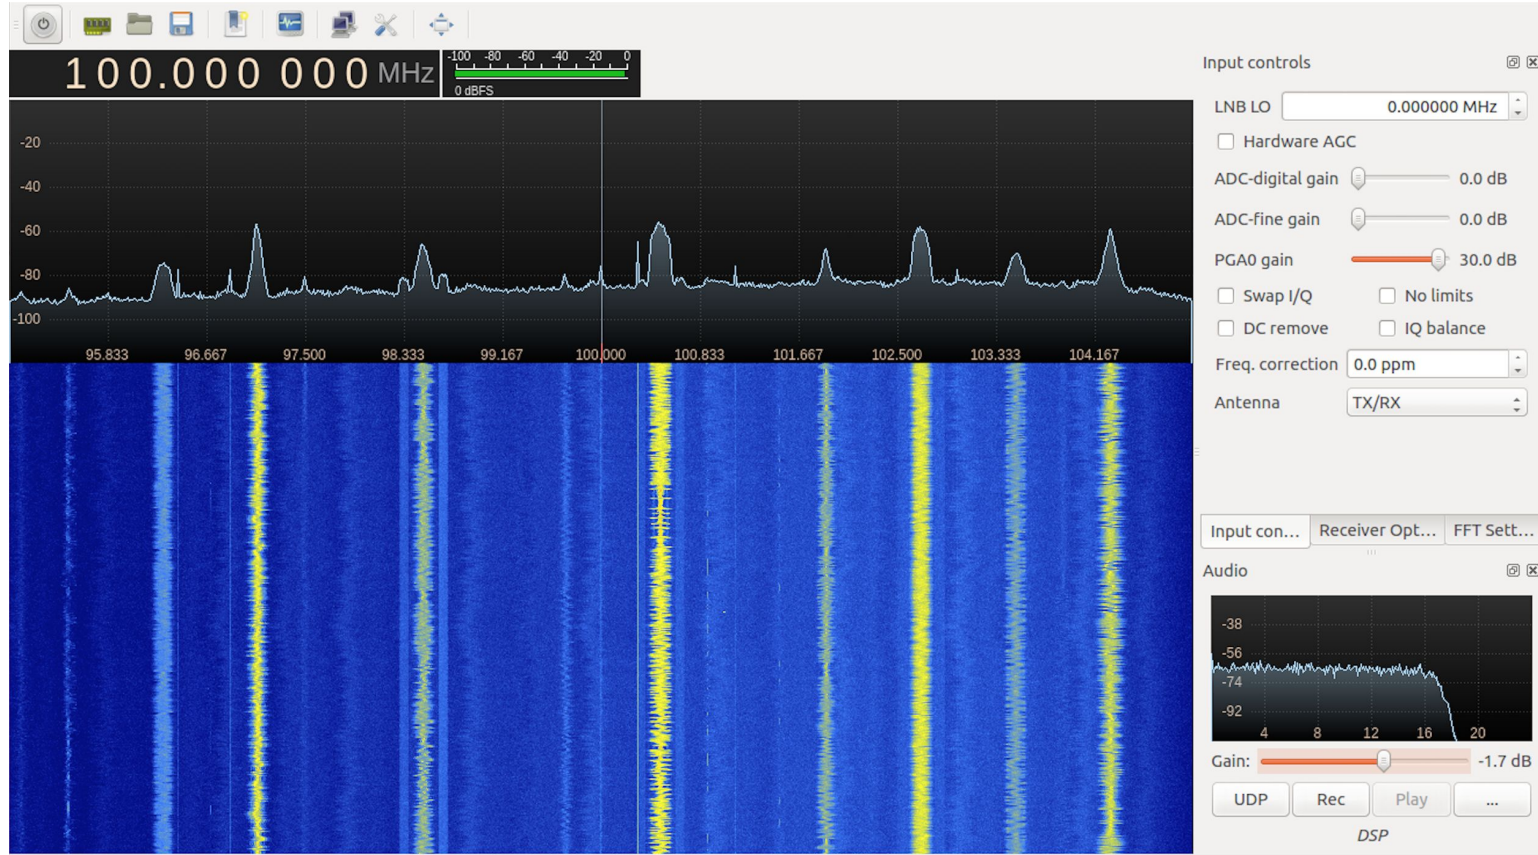

# GQRX Screenshot

# gr-paint

- Based on “Spectrum Painter” by polygon
  - Github: [https://github.com/polygon/spectrum\\_painter](https://github.com/polygon/spectrum_painter)
- gr-OOT created by Ron “drmpeg” Economos
- SDR based OFDM transmitter that "paints" monochrome images into the waterfall
- Converts a byte stream of image data into a 4K IFFT OFDM IQ sequence for transmission
- Github: <https://github.com/drmpeg/gr-paint>

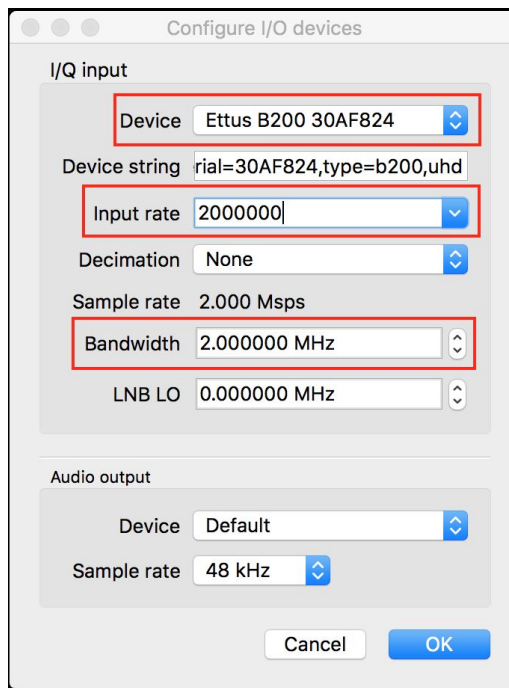

# gr-paint - Installation

1. `git clone https://github.com/drmpeg/gr-paint.git`
2. `cd gr-paint`
3. `mkdir build`
4. `cd build`
5. `cmake ..`
6. `make`
7. `sudo make install`
8. `sudo ldconfig`

# gr-paint - RX demo

1. Open GQRX (`gqrx -r`)
2. Open Devices Menu (or auto popup)
3. Select USRP device
4. Set 2 MS/s sample rate
5. Set 2 MHz Bandwidth
6. Click OK

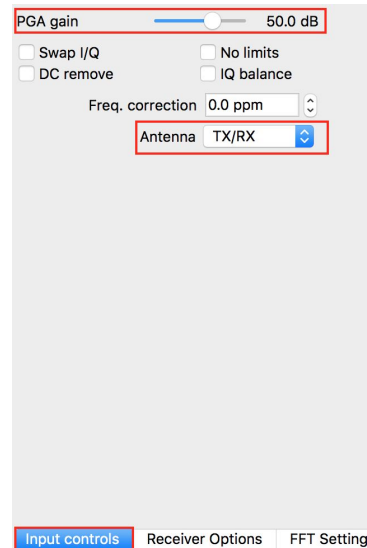

# gr-paint - RX demo

1. In Main GQRX window, click "Play" button
2. Tune to 915 MHz
3. Under "Input controls" tab set Gain to 50-70dB
4. Select proper Antenna

915.000 000 MHz

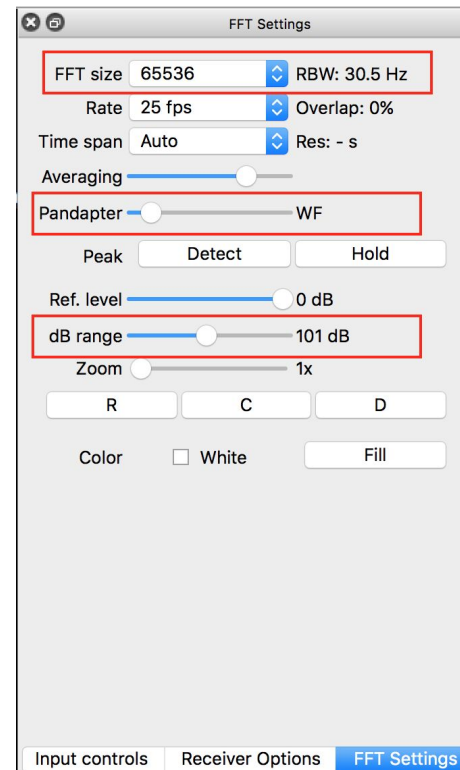

# gr-paint - RX demo

1. Under "FFT Settings" tab set:

FFT Size: 65536

Adjust Pandapter to the left to make Waterfall larger, FFT smaller

dB Range to ~ 100 dB

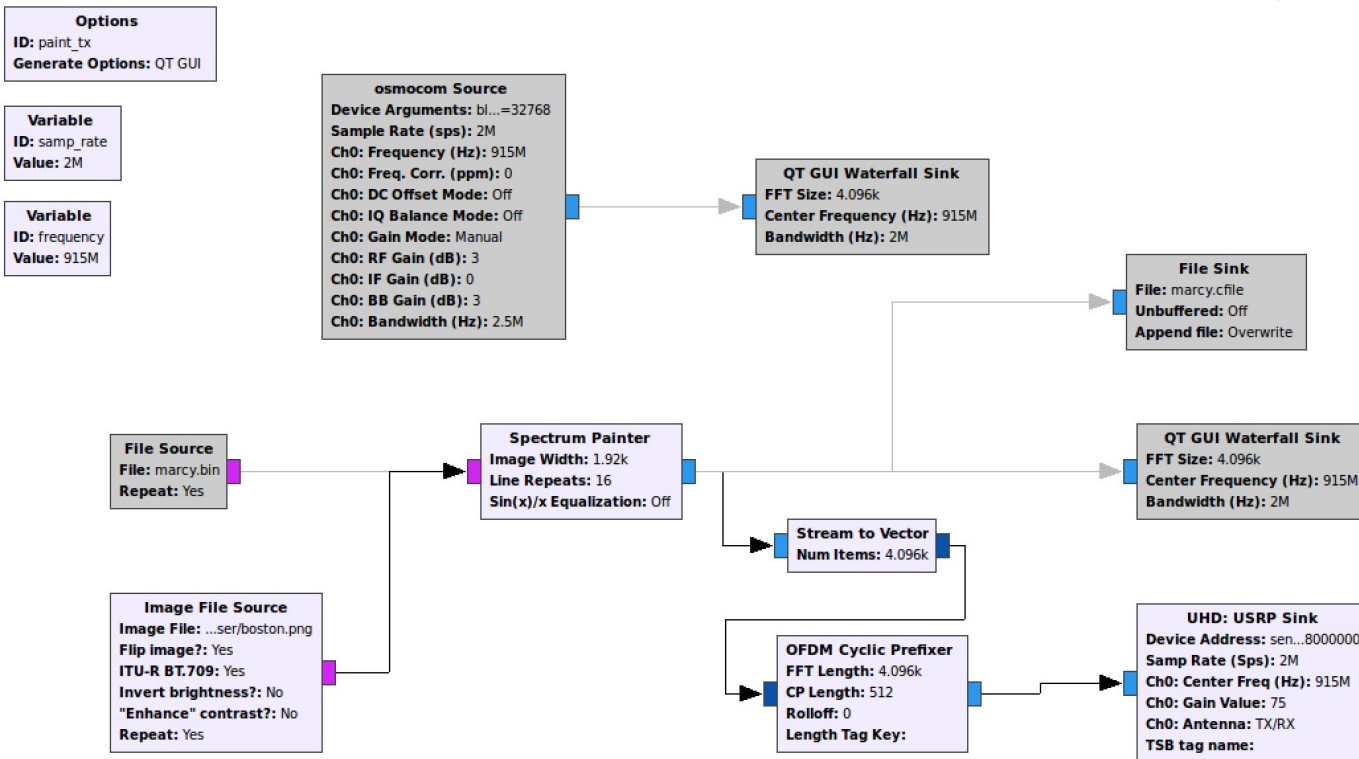

# Demo - gr-paint

[HOME](#) [UTILITIES](#) [WIKI](#) [REFERENCE](#) [ABOUT](#)

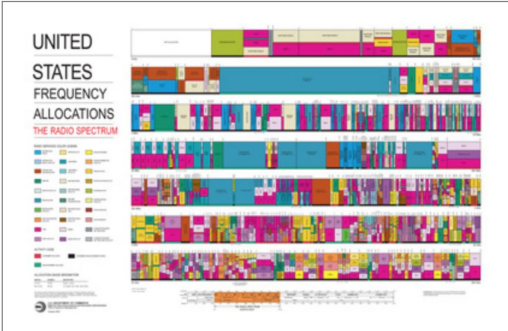

**WELCOME TO SPECTRUMWIKI**

[SpectrumWiki.com](#) is an aggregate of information about the radio spectrum and its many uses. On a band-by-band basis, SpectrumWiki.com contains:

- Allocations
- Pertinent regulatory footnotes
- FCC rule parts
- U.S. spectrum auction revenue
- Engineering data

Additional information about the radio spectrum is contributed on a crowd-sourced basis through a wiki environment, including:

- Spectrum usage (systems and applications)
- Regulatory and legislative actions
- Band plans
- Spectrum measurements
- Historical data

UNITED STATES  
FREQUENCY ALLOCATIONS  
THE RADIO SPECTRUM

This chart displays the frequency allocations for the United States, showing various bands and their corresponding uses. It includes a legend for different types of allocations and a detailed view of the spectrum from 0 to 3000 MHz.

and more. Please see below for more information about contributing to SpectrumWiki.

## Automatic Dependent Surveillance-Broadcast (ADS-B)

**Automatic Dependent Surveillance-Broadcast (ADS-B)** is used by aircraft as an alternative to secondary radar. It broadcasts GPS position (latitude, longitude), pressure, altitude, callsign, as well as track and ground speed separated into messages carrying 10 bytes of data each. ADS-B uses PPM to transmit data.

There are two types of ADS-B:

- one that transmits at 1090 MHz using the mode-S extended squitter (downlink format 17) of the SSR transponder, with about 50 kHz of bandwidth; (Worldwide)
- one that transmits at 978 MHz (UAT, Universal Access Transceiver), using a larger bandwidth of about 1.3 MHz and also transmitting weather data. (US Only)

Frequencies [edit]

- Mode-S extended squitter:** 1090 MHz;
- UAT:** 978 MHz;
- Interrogator:** 1030 MHz.

Decoding Software [edit]

**Professional Software**

- Rohde&Schwarz CA100

Decoding, Plotting, and Sharing Software [edit]

- adsbScope @ Supports several hardware and software decoder arrangements. (Free) (Windows)
- Cocoa1090 @ RTL-SDR-based (Free) (Mac OS X)
- Dump1090 @ Dump1090 is a Mode S decoder specifically designed for RTLSDR devices. It can interface with a large number of devices including RTL dongles, Kinetic SBS1/SBS3 products, and more (Free) (Mac/Linux)
- FlightAware @ provides free licenses for PlanePlotter (above) in exchange for feeding data to FlightAware. Users receive free premium accounts and can track ADS-B participation (Free) (Windows, Linux, Raspberry Pi)

(Based on dump1090), and Android)

- Flightradar24 @ Users are entitled to a Premium account on the Flightradar24 tracking site in exchange for sharing ADS-B data. ADS-B data is sent to their servers, and is plotted on their web site on a Google-based map. Users in sparse coverage areas may be eligible to receive ADS-B monitoring equipment from Flightradar24 in exchange for an agreement to share ADS-B data. (Free) (iOS, Android)
- Modesdeco @
- MultiPSK @ Includes mode S ADS-B
- OpenEAr @
- OpenEAr (YouTube) @
- PlanePlotter @ RTL-SDR and multiple receivers supported. Plots, shares, and can feed other software. The de facto standard software package for decoding ACARS/ADS-B/Mode S/HF Selcal, sharing, plotting, alerting, multilateration, and Beamforming. (Free for 30 days, then Paid. Free licenses available via FlightAware) (Windows)
- SDRangel plugin for ADS-B @
- Virtual Radar Server @ Decodes from several ADS-B receivers or can accept networked data feed. Serves a Google Maps-based display of aircraft positions and flight list. (Free) (Windows)

Decoding Tutorials [edit]

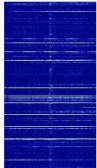

- RTL-SDR Tutorial: Cheap ADS-B Aircraft RADAR @
- Dump1090 Android Tutorial @

Antennas [edit]

ADS-B is vertically polarized. High gain antennas such as collinear antennas with gain directed towards the horizon tend to work well. Other antennas like 1/4 wave ground planes and J-Poles also work well.

## FM Broadcast Radio

**Commercial Broadcast FM** radio stations. Used for the broadcast of many different radio programs, including music, news, sports, weather, and talk shows. Bandwidth for Mono FM is 18 kHz, with a stereo stream it raises up to 54 kHz, if there is RDS the bandwidth is 59 kHz, and if DARC is present it is 92 kHz.

There are a number of variations on the subcarriers that are placed on some FM Broadcast channels. RDS (RBDS in North America), and DARC are some of the data-based subcarriers used to transmit information alongside the FM broadcast. The information includes station name, details of current programming, alerts, traffic information, and more. Broadcasting in stereo FM also uses subcarriers for left and right channels.

In addition, in North America, HD Radio by iBiquity (Now part of DTS) in-band on-channel (IBOC) digital radio technology is broadcast on the outer sidebands of some FM radio stations. They have a distinctive look, two plateaus flanking the main FM analog signal.

### North America

#### Sidebands

Here is a diagram showing the various subcarriers that exist on North American FM Radio Broadcasts:

And this is a MPX extracted sample from a radio station in the United States for comparison:

#### IQ Samples

Here are 5 IQ samples of the MPX Multiplexed FM spectrum.

#### Frequencies

- Common - 87.5 to 108 MHz
- OIRT - 65 MHz to 74 MHz
- Japan - 76 MHz to 90 MHz

#### Subcarriers

**Data Subcarriers**

**Stereo FM Pilots**

# FM Radio Broadcasting

- Commercial FM radio is usually between frequencies 87.8 and 108.0 MHz (USA/Canada)
  - 101 channels total
  - Channels are 200 KHz wide, aligned to a multiple of 100 KHz
  - The FCC physically spaces local FM channels 400 KHz apart
  - In USA and Canada, only odd multiples are used
  - In parts of Europe, India, and Africa, even and odd multiples are used
  - The maximum permitted frequency error of the unmodulated carrier is specified to be within 2000 Hz of the assigned frequency
  - System was originally mono, and stereo was added later in 1960s

- RDS is the Radio Data System, created in 1984
  - In the USA, known as Radio Broadcast Data System (RBDS)
- Standard for embedding small amounts of digital data into commercial FM broadcasts
- RDS transmits time, station identification, programme information, and radio text (currently-playing song title and artist)
- 4 KHz-wide BPSK signal, data rate of 1187.5 bits per second, on a 57 KHz sub-carrier
- The sub-carrier is set to the third harmonic of the 19 KHz stereo pilot tone
- There are exactly 48 cycles of the sub-carrier during every data bit
- Uses CRC for error correction

# RDS Information Fields

- **AF** (alternative frequencies) -- This allows a receiver to re-tune to a different frequency providing the same station when the first signal becomes too weak (e.g., when moving out of range). This is often used in car stereo systems.
- **CT** (clock time) -- Can synchronize a clock in the receiver or the main clock in a car. Due to transmission vagaries, CT can only be accurate to within 100 ms of UTC.
- **EON** (enhanced other networks) -- Allows the receiver to monitor other networks or stations for traffic programmes, and automatically temporarily tune into that station.
- **PI** (programme identification) -- This is the unique code that identifies the station. Every station receives a specific code with a country prefix. In the US, PI is determined by applying a formula to the station's call sign.
- **PS** (programme service) -- This is simply an eight-character static display that represents the call letters or station identity name. Most RDS capable receivers display this information and, if the station is stored in the receiver's presets, will cache this information with the frequency and other details associated with that preset.
- **PTY** (programme type) -- This coding of up to 31 pre-defined programme types (e.g., in Europe: PTY1 News, PTY6 Drama, PTY11 Rock music) allows users to find similar programming by genre. PTY31 seems to be reserved for emergency announcements in the event of natural disasters or other major calamities.
- **REG** (regional) -- This is mainly used in countries where national broadcasters run "region-specific" programming such as regional opt-outs on some of their transmitters. This functionality allows the user to "lock-down" the set to their current region or let the radio tune into other region-specific programming as they move into the other region.
- **RT** (radio text) -- This function allows a radio station to transmit a 64-character free-form text that can be either static (such as station slogans) or in sync with the programming (such as the title and artist of the currently playing song).
- **TA, TP** (traffic announcement, traffic programme) -- The receiver can often be set to pay special attention to this flag and, for example, stop the tape/pause the CD or retune to receive a traffic bulletin. The TP flag is used to allow the user to find only those stations that regularly broadcast traffic bulletins whereas the TA flag is used to signal an actual traffic bulletin in progress, with radio units perhaps performing other actions such as stopping a cassette tape (so the radio can be heard) or raising the volume during the traffic bulletin.
- **TMC** (traffic message channel) -- Digitally encoded traffic information. Not all RDS equipment supports this, but it is often available for automotive navigation systems. In many countries only encrypted traffic data is broadcast, and so an appropriate decoder, possibly tied to a subscription service, is required to use the traffic data.

# Supported Hardware & Software

- Supported Hardware
  - Depends on processing load and I/Q data rates
  - Intel i7 or i9 CPU is ideal
    - Minimum 3.0 GHz clock speed, 6 cores
  - Intel i3 and i5 can work too (*with lighter loads and lower sampling rates*)
  - Apple M1 CPU in macOS 11, 12
    - Performance results pending
  - Raspberry Pi 3 and 4 on ARM CPU (*with lighter loads and lower sampling rates*)
- Supported Software
  - Linux is the de-facto “standard” operating system
    - Most development done on Linux, most users on Linux
    - Ubuntu and Fedora
    - Installation guides on Ettus and GNU Radio websites
  - Apple macOS also works well
  - Windows support lacking but improving, use scripts from Geof Nieboer
    - <http://www.gcndevelopment.com/gnuradio/index.htm>
    - [https://github.com/gnieboer/GNURadio\\_Windows\\_Build\\_Scripts](https://github.com/gnieboer/GNURadio_Windows_Build_Scripts)
  - Conda from Ryan Voltz at MIT Haystack
    - <https://github.com/ryanvolz/radioconda>
    - <https://wiki.gnuradio.org/index.php/CondaInstall>
